

VEHICULAR ANTENNAS ON NATO BASE

Damped Oscillation Antennas

Synergy introduces a new range of Vehicular Antennas for military platforms. Suitable for land and marine vehicles, these antennas combine compact dimensions, robust construction and excellent electrical performance with 90° positioning flexibility.

Thanks to a technology developed by Synergy, the antenna base offers both flexibility to adapt to various installation constraints and vibration damping to prevent unwanted oscillations that can degrade transmission quality and cause mechanical wear. The result is improved reliability and an extended service life.

FEATURES & BENEFITS

- Better signal continuity:
No parasitic oscillation
- Extended lifetime: Fewer oscillations
- Harsh environment proof:
Antenna bends up to 90°

APPLICATIONS

- Synergy's Vehicular Antennas are designed for mobile radio installations requiring high power to communicate with central command bases: - Military terrestrial vehicles of all types
- Military shipboards
